

Practical Exam Theory

- This project focus on analysing customer data by combining multiple dataset and preparing them for further use.
- Missing values were handled using basic methods like mean, median, and proper conversions, inconsistent data such as formats and category values were cleaned and Standardized. Outliers were checked using z-score and Iqr both.
- Feature engineering was done by encoding categorical data and creating new transformed features. Log and sqrt were applied to reduce skewness. Scaling was used to bring numerical into a common range.
- All data sets were merged on common columns like User-Id and product ID.
- In conclusion, Dataset is now properly prepared and can be used for further analysis.
